Algebraic Foundations for Type and Effect Analysis

Ohad Kammar <ohad.kammar@ed.ac.uk> Gordon Plotkin <gdp@ed.ac.uk>

EWCE, March 18, 2011

(another work in progress)

Effect Systems

$$\Gamma \vdash M_i : A_i ! \varepsilon_i$$

Effect-Dependent Optimisations [Benton et al.]

$$arepsilon_i \subseteq \{ \texttt{lookup} \} \implies \begin{split} & \texttt{let } x = M_1 \texttt{ in } (\texttt{let } y = M_2 \texttt{ in } N) \\ & \equiv \\ & \texttt{let } y = M_2 \texttt{ in } (\texttt{let } x = M_1 \texttt{ in } N) \end{split}$$

Difficulty

Change language \implies reprove from scratch.

Solution

General semantic account of effect type systems.

Tool

Algebraic theory of effects.

▲□ > < □ > < □</p>

Observation [Wadler]

Change notation:

$$\Gamma \vdash M : T_{\varepsilon}A$$

 T_{ε} behaves like a monad.

Our Idea

- Elements in ε are effect operations.
- ε is the signature for T_{ε} .
- Which equations?

Ohad Kammar, Gordon Plotkin Algebraic Foundations for Type and Effect Analysis

Benchmark Model

$$\mathcal{L}_{\varepsilon} \coloneqq \mathcal{L}$$

Original meaning.

Discards effect analysis.

Relating Models

Logical relations for comparing other models against benchmark.

向下 イヨト イヨ

Conservative Restriction

 $\mathcal{L}_{\varepsilon} \coloneqq$ all terms over ε , and \mathcal{L} equations between them. Categorically:

Original meaning.

Uses effect analysis.

Finding $\mathcal{L}_{\varepsilon}$ is non-trivial.

Ifcs Laboratory for Foundations of Computer Science

◎ ▶ ★ 注 ▶ ★ 注

Idea

Restrictions of $\mathcal{L} = \mathcal{L}^1 \cap \mathcal{L}^2$ in terms of component restrictions.

Sum Theorem

For consistent finitary Lawvere theories:

$$(\mathcal{L}^1+\mathcal{L}^2)_{arepsilon_1+arepsilon_2}=\mathcal{L}^1_{arepsilon_1}+\mathcal{L}^2_{arepsilon_2}$$

Tensor Counterexample

Eckmann-Hilton:

 $(\mathsf{Monoids}\otimes\mathsf{Monoids})_{\{\cdot,1\}+\emptyset}=\mathsf{Commutative}\;\mathsf{Monoids}$

In particular:
$$x \cdot y = y \cdot x$$

IDENTIFY OF CONTINUES

| 4 回 2 4 三 2 4 三 4 三

Observation

In practice:

Sum: Free theories. Tensor: Global state, reader and writer.

Our Idea

Analyse restrictions in these cases only.

- Works in **Set**.
- Ę
 - Subtle in *ω***CPO**: Works for the above theories, but may fail for others (non-determinism).

伺 とく ヨ とく

Validity $\mathcal{M} \models \mathcal{M} = \mathcal{N} \iff \llbracket \mathcal{M} \rrbracket = \llbracket \mathcal{N} \rrbracket$ in \mathcal{M} .

Cataloguing Optimisations

For existing transformations:

- Validate.
- Classify.
- Generalise.

(4回) (4日) (4日)

Structural

- β , η rules.
- Sequencing.
- Coercion, e.g.:

$$coerce_f(coerce_g M) = coerce_{f \circ g} M$$

- Handlers:
 - β: try (return_ε V) with H @ P as x in N = N[V/x]'P (Pretnar's thesis)
 - More can be said for user-defined handlers.
 - Others?

▲□ ▶ ▲ □ ▶ ▲ □

Algebraic Equations in the underlying Lawvere theory, e.g.:

$$update_V(lookup(N)) = update_V N'V$$

| 4 回 2 4 三 2 4 三 4 三

Abstract

Monadic properties of C_{ε} yield optimisations, e.g. discard:

$$\frac{T_{\varepsilon} \text{ affine } \Gamma \vdash_{\varepsilon} M : F_{\varepsilon}A \quad \Gamma \vdash_{\varepsilon'} N : B}{\Gamma \vdash_{\varepsilon'} (\text{coerce}_f M) \text{ to } x \text{ in } N = N}$$

Algebraic View

When T_{ε} is algebraic:

$$T_{\varepsilon} \text{ affine } \iff \int_{x \cdots x}^{f} = x \quad (\text{absorption law holds})$$

Modularity of combination.

Ifcs Laboratory for Foundations of Computer Science

Copy Optimisation

 $\frac{T_{\varepsilon} \text{ relevant } \Gamma \vdash_{\varepsilon} M : F_{\varepsilon}A \quad \Gamma, x : A, y : A \vdash_{\varepsilon'} N : \underline{B}}{(\operatorname{coerce}_{f}M) \text{ to } x \text{ in } (\operatorname{coerce}_{f}M) \text{ to } y \text{ in } N = (\operatorname{coerce}_{f}M) \text{ to } x \text{ in } N[x/y]}$

Definition Commutative monad *T*:

▲□ > < □ > <</p>

Definition Commuting monad morphisms $T_1 \rightarrow T \leftarrow T_2$:

| 4 回 2 4 三 2 4 三 4 三

Commute Optimisation

$$\begin{array}{ccc} & T_{\varepsilon_{1}} \xrightarrow{m_{1}} T_{\varepsilon} \xleftarrow{m_{2}} T_{\varepsilon_{2}} \text{ commute} \\ & & \Gamma \vdash_{\varepsilon_{i}} M_{i} : F_{\varepsilon_{i}}A_{i} \quad \Gamma, x_{1} : A_{1}, x_{2} : A_{2} \vdash_{\varepsilon} N : \underline{B} \\ \hline & & (\operatorname{coerce}_{f_{1}}M_{1}) \text{ to } x_{1} \text{ in } (\operatorname{coerce}_{f_{2}}M_{2}) \text{ to } x_{2} \text{ in } N = \\ & & & (\operatorname{coerce}_{f_{2}}M_{2}) \text{ to } x_{2} \text{ in } (\operatorname{coerce}_{f_{1}}M_{1}) \text{ to } x_{1} \text{ in } N \end{array}$$

Algebraic View

 m_1 translations commute with m_2 translations.

Corollary $T_1 \rightarrow T_1 \otimes T_2 \leftarrow T_2$ commute.

Ifcs Laboratory for Foundations of Computer Science

▲□ > < □ > < □</p>

Hoist Optimisation

$$T_e = \mathrm{id}$$

$$\Gamma \vdash_{\varepsilon} M : F_{\varepsilon}A \quad \Gamma, x : A \vdash_{\varepsilon'} N : \underline{B}$$

$$\operatorname{return}_{\varepsilon} (\operatorname{thunk}_{\varepsilon'}((\operatorname{coerce}_f M) \operatorname{to} x \operatorname{in} N)) =$$

$$M \operatorname{to} x \operatorname{in} (\operatorname{return}_{\varepsilon} (\operatorname{thunk}_{\varepsilon'} N))$$

Caveats

- Generalise?
- Algebraic view?

・日・ ・ ヨ ・ ・

Models Again

Modular Approximation Model

e.g.:

$$\mathcal{L} \coloneqq \mathcal{L}^1 + (\mathcal{L}^2 \otimes \mathcal{L}^3)$$

with $\mathcal{L}^{i} \sim \langle \Sigma_{i}, E_{i} \rangle$. Approximation model, with $\varepsilon_{1}^{i} + \varepsilon_{2}^{i} + \varepsilon_{3}^{i} \subseteq \Sigma^{1} + \Sigma^{2} + \Sigma^{3}$:

Ohad Kammar, Gordon Plotkin Algebraic Foundations for Type and Effect Analysis

Approximation Model $\models M = N \implies$ Benchmark Model $\models M = N$

Modularity.

- Equational soundness.
- Approximation only.

Conclusions

- Algebraically directed research.
- Modular account.
- A general account, in ascending degree.

Further work

- Effect reconstruction.
- More ωCPO.
- Logical relations.
- Handlers.
- Rewriting.

Laboratory for Foundations of Computer Science

- More optimisations?
- Atkey's permissions.
- More effects.
- Concurrency.
- Presheaf models.
